

Sentinel Command — 8-minute jury demo script

Print this. Laptop: API <http://127.0.0.1:8000> and UI <http://localhost:5174> already running. Grid password already in local .env. Do not show .env to the room.

Timed run

Time	Click	Say	If it fails
0:00–0:40	Map of Gujarat pins	Hybrid Model 1 + 2. We do not replace departmental VMS. Registry first, then analytics.	Refresh UI.
0:40–1:20	Fetch Sentinel grid	Catalogue from official cameras.json. Thirty sandbox cameras. Export registry CSV.	Use cached 30 pins; say catalogue was imported.
1:20–2:10	Camera 4 or 12 — player	Unified viewing: HLS in one UI, same grid as the portal.	Open cctv.corp8.cloud in a tab; same password session.
2:10–3:20	Cam-AHM-Gate: Extract → Detect	Own feed. Close plates. YOLO boxes, RapidOCR.	Events already in store — scroll the list.
3:20–4:00	Watchlist GJ01AB1234	Representative stolen list, allowed by the brief. Red banner is events $\cap$ watchlist.	Add the plate again; banner uses existing events.
4:00–5:00	Hunt GJ01AB1234 → Export CSV	This is the scoring test: number in, route + timestamps + evidence.	CSV file hunt-GJ01AB1234.csv is in the jury pack.
5:00–6:20	Camera 4 live: Capture → Detect	Government RTSP TCP per integrator guide. Vehicles + IST times. If plate unread, distance — not a missing model.	Show Paldi rows in the output report.
6:20–7:20	Architecture / scale slide	Same APIs. Postgres, zone workers, VAHAN adapter later. 80k is more machines, not a rewrite.	HLD PDF in the pack.
7:20–8:00	Stop. Ask for their number	Paste designated registration into Hunt.	Capture 4, 5, 12 then Detect, Hunt again. Do not freeze.

Lines to say

“Model 1 is the GIS foundation; Model 2 is viewing and ANPR on feeds we are given.” “We consume standard RTSP and HLS; we do not replace MediaMTX.” “Watchlist is ours for the sandbox; VAHAN is an API adapter in Phase 2.” “Short samples, not a 24-hour DVR.”

Do not say

We integrated 80,000 cameras. We have face or live VAHAN. ANPR always reads Paldi. We built Model 3 and 4.

Backup media

If live RTSP/HLS blips: Gate + Paldi + Visat MP4s. Same Extract / Detect / Hunt pipeline. Output report and hunt CSV are already generated from the working store.
